(Received: Aug. 09, 2024 Accepted: Dec. 29, 2024 Published: Dec. 30, 2024)

**Abstract:** In this paper, we introduce the  $(\Lambda, \delta S)$  - continuity via  $(\Lambda, \delta S)$  - closed sets and the theorems based on them are discussed with counterexamples. Moreover, we entitle the Quasi  $(\Lambda, \delta S)$  continuity, Perfect  $(\Lambda, \delta S)$  - continuity, Totally  $(\Lambda, \delta S)$  - continuity, Strongly  $(\Lambda, \delta S)$  - continuity, Contra  $(\Lambda, \delta S)$  - continuity by applying  $(\Lambda, \delta S)$  - closed sets.

**Keywords and Phrases:**  $(\Lambda, \delta S)$ -closed set,  $(\Lambda, \delta S)$  - continuity, Quasi  $(\Lambda, \delta S)$  continuity, Perfect  $(\Lambda, \delta S)$  - continuity, Totally  $(\Lambda, \delta S)$  - continuity, Strongly  $(\Lambda, \delta S)$  - continuity, Contra  $(\Lambda, \delta S)$  - continuity.

**2020 Mathematics Subject Classification:** 54A35.

### 1. Introduction

In topology and its applications, the concept of a closed set is fundamental. Many researchers have defined classes of closed sets (see [1, 2, 5, 10, 11]); through them, new definitions of compactness and continuity have been found, see [10, 13]. From this point of view, we have defined a new class of open sets, namely  $(\Lambda, \delta S)$  - closed sets. Park. et al. (1997) introduce the notion of  $\delta$  - semi-open sets, which are stronger than semi-open sets but weaker than  $\delta$  - open sets. Georgiou (2004) developed the theory on generalization of  $\delta$  - closed sets which is named as  $(\Lambda, \delta)$  - closed sets using  $\Lambda$  - operator in terms of  $\delta$ . In 2014, Binod Chandra Tripathy introduced the concept of generalized b-closed sets with respect to an ideal in

bitopological spaces, which is the extension of the concepts of generalized b-closed sets. In 2013, Binod Chandra Tripathy et. al, introduced the concept of weakly b-continuous functions in bitopological spaces as a generalization of b-continuous functions and studied several properties of these functions. In 2011, Binod Chandra Tripathy et. al introduced the notion of b-locally open sets,  $bLO_*$  sets,  $bLO_{**}$  sets in bitopological spaces and obtain several characterizations and some properties of these sets.

Similarly we have introduced the concept of  $(\Lambda, \delta S)$  -closed sets were introduced in [13]. By using  $(\Lambda, \delta S)$  - closed sets in this article we introduced  $(\Lambda, \delta S)$  continuity (resp.,  $(\Lambda, \delta S)$  - irresoluteness, Quasi  $(\Lambda, \delta S)$  - irresoluteness, Completely  $(\Lambda, \delta S)$  - irresoluteness) concepts are defined using  $(\Lambda, \delta S)$  - closed and some of their properties are analyzed, and we extend various results, properties concerning these concepts.

## 2. Preliminary

Throughout this paper  $(P, \sigma), (Q, \tau)$  and  $(R, \eta)$  (simply  $P, Q, R$ ) always mean topological space. The closure (resp., interior) will be denoted by  $Cl(R)$  (resp.,  $Int(R)$ ). Let  $R$  be a subset of  $P$ .

**Definition 1.** A subset  $R$  of a topological space  $(P, \sigma)$  is called  $\delta$ -open if  $R$  is the union of regular open sets. The complement of  $\delta$ -open is called  $\delta$ -closed.

**Lemma 1.** The intersection of arbitrary collection of  $\delta$  - semiclosed sets in  $(P, \sigma)$  is  $\delta$  - semiclosed.

**Definition 2.** Let  $R$  be a subset of a topological space  $(P, \sigma)$ . Then  $\Lambda_{\delta S}(R)$  [also called  $Ker_{\delta S}(R)$ ] is defined as follows:

$$\Lambda_{\delta S}(R) = \cap \{ U \in \delta SO(P, \sigma) / R \subseteq U \}.$$

**Definition 3.** A subset  $R$  a topological space  $(P, \sigma)$  is known as  $(\Lambda, \delta S)$  - set if  $R = \Lambda_{\delta S}(R)$ .

**Definition 4.** A subset  $R$  of a topological space  $(P, \sigma)$  is called  $\lambda_g^{\delta S}$  - closed sets if  $sCl_{\delta}(R) \subseteq U$  whenever  $R \subseteq U$  and  $U$  is  $(\Lambda, \delta S)$ -open in  $P$ . The family of all  $\lambda_g^{\delta S}$  - closed sets of  $(P, \sigma)$  is denoted by  $\lambda_g^{\delta S}C(P, \sigma)$ .

**Definition 5.** Continuous : If  $f^{-1}(V)$  is a closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 6.** Semi - continuous : If  $f^{-1}(V)$  is a semi - closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 7.**  $\delta$  - continuous : If  $f^{-1}(V)$  in  $(P, \sigma)$  for every  $\delta$  - closed set  $V$  in

$(Q, \tau)$ .

**Definition 8.**  $\delta$  - semi continuous : if  $f^{-1}(V)$  is a  $\delta$ -semi closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 9.**  $\delta gs$  - continuous : if  $f^{-1}(V)$  is a  $\delta gs$ -closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 10.**  $g\delta s$  - continuous : if  $f^{-1}(V)$  is a  $g\delta s$ -closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 11.**  $sg$  - continuous : if  $f^{-1}(V)$  is a  $sg$ -closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 12.**  $gs$  - continuous : if  $f^{-1}(V)$  is a  $gs$ -closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 13.**  $\delta g$  - continuous : if  $f^{-1}(V)$  is a  $\delta g$ -closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Definition 14.**  $\lambda_g^\delta$  - continuous : A function  $f : (P, \sigma) \rightarrow (Q, \tau)$  is said to be  $\lambda_g^\delta$  - continuous if the inverse image of every open set in  $(Q, \tau)$  is  $\lambda_g^\delta$  - open in  $(P, \sigma)$ .

**Definition 15.** Super - continuous : if  $f^{-1}(V)$  is a  $\delta$ -closed set of  $(P, \sigma)$  for every closed set  $V$  of  $(Q, \tau)$ .

**Definition 16.** Contra - continuous : if  $f^{-1}(V)$  is a  $\delta$ -closed set of  $(P, \sigma)$  for every closed set  $V$  of  $(Q, \tau)$ .

**Definition 17.** Strongly - continuous : if  $f^{-1}(V)$  is a closed in  $(P, \sigma)$  for every open subset  $V$  in  $(Q, \tau)$ .

**Definition 18.** Totally - continuous : if  $f^{-1}(V)$  is a clopen in  $(P, \sigma)$  for every open subset  $V$  in  $(Q, \tau)$ .

**Definition 19.**  $\alpha$  - continuous : if  $f^{-1}(V)$  is a  $\alpha$  - closed set in  $(P, \sigma)$  for every closed set  $V$  in  $(Q, \tau)$ .

**Lemma 2.** In a topological space  $(P, \sigma)$  the following properties hold.

a) Every  $\delta$ -semiclosed set is  $(\Lambda, \delta S)$ -closed set.

b) Every  $\delta$ -open set is  $\delta$ -semiopen set.

c) Every  $\delta$ -semiclosed set is  $\lambda_g^{\delta S}$  - closed set.

d) Every  $\delta$ -closed set is  $\lambda_g^{\delta S}$  - closed set.

e) Every regular closed set is  $\lambda_g^{\delta S}$  - closed set.

f) Every  $\lambda_g^{\delta S}$  - closed set is  $\delta g s$ -closed set.

g) Every  $\lambda_g^{\delta S}$  - closed set is  $g \delta s$ -closed set.

### 3. $(\Lambda, \delta S)$ -continuous function

**Definition 20.** A map  $f : (P, \sigma) \rightarrow (Q, \tau)$  is called  $(\Lambda, \delta S)$ -continuous function if the inverse image  $f^{-1}(V)$  of each open set  $V$  in  $(Q, \tau)$  is  $(\Lambda, \delta S)$ -open in  $(P, \sigma)$ .

#### Theorem 1.

a) Every  $\delta$ -semicontinuous function is  $(\Lambda, \delta S)$  continuous function.

b) Every super continuous function is  $(\Lambda, \delta S)$  continuous function.

**Proof.** a) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be  $\delta$ -semicontinuous. Then for  $V \in \tau$ ,  $f^{-1}(V)$  is  $\delta$ -semiopen. But by Lemma 1(a),  $V$  is  $(\Lambda, \delta S)$  - open. Therefore  $f$  is  $(\Lambda, \delta S)$  - continuous.

b) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be super continuous. Then for  $V \in \tau$ ,  $f^{-1}(V)$  is  $\delta$ -open. But by Lemma 1(b),  $f^{-1}(V)$  is  $\delta$ -semiopen. Therefore  $f$  is  $\delta$ -semicontinuous. By (a),  $f$  is  $(\Lambda, \delta S)$  continuous.

**Example 1.** a) Let  $P = Q = \{p, q, r, s\}$  and  $\sigma = \{P, \emptyset, \{p\}, \{r\}, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, r, s\}\}$ ,  $\tau = \{Q, \emptyset, \{p, q, r\}\}$ . Let a function  $f : (P, \sigma) \rightarrow (Q, \tau)$  be defined by  $f(p) = f(q) = f(r) = s$ ,  $f(s) = r$ . Then  $f$  is  $(\Lambda, \delta S)$  continuous but not a  $\delta$ -semicontinuous function.

b) Let  $P = Q = \{p, q, r, s\}$  and  $\sigma = \{P, \emptyset, \{p\}, \{q\}, \{p, q\}\}$ ,  $\tau = \{Q, \emptyset, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$ . Let a function  $f : (P, \sigma) \rightarrow (Q, \tau)$  defined be an identity. Then  $f$  is  $(\Lambda, \delta S)$  continuous but not a super continuous function.

**Definition 21.** A function  $f : (P, \sigma) \rightarrow (Q, \tau)$  is called  $(\Lambda, \delta S)$  - **irresolute** if  $f^{-1}(V)$  is a  $(\Lambda, \delta S)$  - open subset of  $P$  for every  $(\Lambda, \delta S)$  - open subset  $V$  of  $Q$ .

**Quasi -  $(\Lambda, \delta S)$  - irresolute** if  $f^{-1}(V)$  is a  $(\Lambda, \delta S)$  - open subset of  $P$  for every  $\delta$ -semiopen subset of  $Q$ .

**Theorem 2.** For a function  $f : (P, \sigma) \rightarrow (Q, \tau)$ , the following statements are equivalent:

a)  $f$  is  $(\Lambda, \delta S)$  - irresolute;

b)  $f^{-1}(B)$  is a  $(\Lambda, \delta S)$  - closed subset of  $P$  for every  $(\Lambda, \delta S)$  - closed subset  $B$  of  $Q$ ;

- c) For each  $x \in P$  and for each  $(\Lambda, \delta S)$  – open set  $V$  of  $Q$  containing  $f(x)$  there exists a  $(\Lambda, \delta S)$  – open set  $U$  of  $P$  containing  $x$  and  $f(U) \subseteq V$ ;
- d)  $f((\Lambda, \delta S)Cl(A)) \subseteq [f((\Lambda, \delta S)Cl(A))]$  for each subset  $A$  of  $P$ ;
- e)  $[f^{-1}(\Lambda, \delta S)Cl(A)] \subseteq f^{-1}(\Lambda, \delta S)Cl(A)$  for each subset  $B$  of  $Q$ ;

**Proof. Claim (a)  $\Leftrightarrow$  (b)**

Assume that  $f$  is  $(\Lambda, \delta S)$  – irresolute. Let  $W$  be any  $(\Lambda, \delta S)$ -closed subset of  $Q$ . Then  $Q - W$  is  $(\Lambda, \delta S)$ -open. Since  $f$  is  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(Q - W)$  is  $(\Lambda, \delta S)$ -open. But  $f^{-1}(Q - W) = f^{-1}(Q) - f^{-1}(W) = P - f^{-1}(W)$  is  $(\Lambda, \delta S)$  – open. therefore  $f^{-1}(W)$  is  $(\Lambda, \delta S)$  – closed. Conversely, Let us assume  $W$  be a  $(\Lambda, \delta S)$  – open set of  $Q$ . Then  $Q - W$  is  $(\Lambda, \delta S)$  – closed in  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  – irresolute inverse image of each  $(\Lambda, \delta S)$  – closed set in  $Q$  is  $(\Lambda, \delta S)$  – closed in  $P$ , then  $f^{-1}(Q - W)$  is  $(\Lambda, \delta S)$  – closed in  $P$  (i.e)  $f^{-1}(Q) - f^{-1}(W)$  is  $(\Lambda, \delta S)$  – closed in  $P$  (i.e)  $P - f^{-1}(W)$  is  $(\Lambda, \delta S)$  – closed in  $P$ . Hence  $f^{-1}(W)$  is  $(\Lambda, \delta S)$  – open in  $P$ .  $\Rightarrow f$  is  $(\Lambda, \delta S)$  – irresolute.

**Claim (b)  $\Leftrightarrow$  (c)**

Let  $x \in P$  and  $V$  be any  $(\Lambda, \delta S)$  – open set of  $Q$  such that  $f(x) \in V$ . Then  $Q - V$  is  $(\Lambda, \delta S)$  – closed set and  $f^{-1}(Q - V)$  is  $(\Lambda, \delta S)$  – closed in  $P$ . As  $f(x) \notin Q - V$ ,  $x \notin f^{-1}(Q - V) = P - f^{-1}(V) \Rightarrow x \in f^{-1}(V)$  which is  $(\Lambda, \delta S)$  open in  $P$ . Let  $U = f^{-1}(V)$ . Then  $x \in U$  and  $f(U) \subseteq V$ . Thus  $U$  is the required  $(\Lambda, \delta S)$  – open set such that  $x \in U$  and  $f(U) \subseteq V$ . Which implies (C) Conversely, Let  $W$  be  $(\Lambda, \delta S)$  closed in  $Q$ . Thus let  $V = Q - W$  then  $V$  be a  $(\Lambda, \delta S)$ -open set of  $Q$  and  $x \in f^{-1}(V)$ . Then  $f(x) \in v$  By condition (c) there exists a  $(\Lambda, \delta S)$  – open set  $U_x$  in  $P$  such that  $x \in U_x$  and  $f(U_x) \subseteq V$  therefore  $x \in U_x \subseteq f^{-1}(V)$  Hence  $f^{-1}(V) = \cup U_x / x \in f^{-1}(V)$ . we have  $f^{-1}(V)$  is  $(\Lambda, \delta S)$  – open in  $P$  Hence  $P - f^{-1}(V) = f^{-1}(Q - V) = f^{-1}(W)$ . Which implies (b).

**Claim (b)  $\Leftrightarrow$  (d)**

Let  $A$  be any subset of  $P$ . Since  $((\Lambda, \delta S)Cl(f(A)))$  is  $(\Lambda, \delta S)$  – closed in  $Q$ . Then by using (b)  $f^{-1}((\Lambda, \delta S)Cl(f(A)))$  is  $(\Lambda, \delta S)$  – closed in  $P$ . Now  $A \subseteq f^{-1}(f(A)) \subseteq f^{-1}((\Lambda, \delta S)Cl(f(A)))$  Now  $f((\Lambda, \delta S)Cl(A)) \subseteq f(f^{-1}((\Lambda, \delta S)Cl(f(A)))) \subseteq (\Lambda, \delta S)Cl(f(A))$  therefore  $f((\Lambda, \delta S)Cl(A)) \subseteq (\Lambda, \delta S)Cl(f(A))$  Conversely, Let  $V$  be a  $(\Lambda, \delta S)$ -Closed subset of  $Q$ . Then  $f^{-1}(V) \subseteq P$ . By (d),  $f((\Lambda, \delta S)Cl(f^{-1}(V))) \subseteq (\Lambda, \delta S)Cl(f(f^{-1}(V))) \subseteq (\Lambda, \delta S)Cl(V) = V$   $f^{-1}(f((\Lambda, \delta S)Cl(f^{-1}(V)))) \subseteq f^{-1}(V) \Rightarrow (\Lambda, \delta S)Cl(f^{-1}(V)) \subseteq f^{-1}(V)$   $f^{-1}(V) \subseteq ((\Lambda, \delta S)Cl(f^{-1}(V))) \Rightarrow f^{-1}(V) = (\Lambda, \delta S)Cl(f^{-1}(V))$  Hence  $f^{-1}(V)$  is a  $(\Lambda, \delta S)$  closed subset of  $P$  for every  $(\Lambda, \delta S)$  closed subset of  $Q$ .

**Claim (d)  $\Leftrightarrow$  (e)**

Let  $B$  be a subset of  $Q$ . Then  $f^{-1}(B)$  is a subset of  $P$ . By (d)  $f((\Lambda, \delta S)Cl(f^{-1}(B))) \subseteq (\Lambda, \delta S)Cl(f(f^{-1}(B))) \subseteq (\Lambda, \delta S)Cl(B)$  Hence  $(\Lambda, \delta S)Cl(f^{-1}(B)) \subseteq f^{-1}((\Lambda, \delta S)Cl(B))$

Conversely, Let  $A$  be a subset of  $Q$ . Take  $B = f(A)$  By (e)  $(\Lambda, \delta S)Cl(A) \subseteq f^{-1}(\Lambda, \delta S)Cl(f(A))$ . Hence  $f((\Lambda, \delta S)Cl(A)) \subseteq (\Lambda, \delta S)Cl(f(A))$  Hence the proof.

**Theorem 3.** For a function  $f : (P, \sigma) \rightarrow (Q, \tau)$ , the following statements are equivalent:

- a)  $f$  is quasi- $(\Lambda, \delta S)$ -irresolute:
- b)  $f^{-1}(B)$  is a  $(\Lambda, \delta S)$  – closed subset of  $P$  for every  $\delta$ -semiclosed subset  $B$  of  $Q$ .
- c) for each  $x \in P$  and for each  $\delta$  – semiopen set  $V$  of  $Q$  containing  $f(x)$  there exists a  $(\Lambda, \delta S)$  – open set  $U$  of  $P$  containing  $x$  and  $f(U) \subseteq V$ .

**Proof.** Obvious.

**Theorem 4.** For a function  $f : (P, \sigma) \rightarrow (Q, \tau)$ , the following statements are true

- a) If the map  $f$  is  $(\Lambda, \delta S)$  – irresolute, then the map  $f$  is quasi –  $(\Lambda, \delta S)$  – irresolute.
- b) If the map  $f$  is  $\delta$  – semicontinuous, then the map  $f$  is  $(\Lambda, \delta S)$  – continuous.
- c) If the map  $f$  is  $\delta$  – semiclosed, then the map  $f$  is  $(\Lambda, \delta S)$  – irresolute.

**Proof.** a) Let  $V$  be any  $\delta$  – semiclosed subset of  $Q$ .

By Lemma 1, we get  $V$  is  $(\Lambda, \delta S)$  – closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is  $(\Lambda, \delta S)$  – closed in  $P$ .  $\Rightarrow f$  is quasi  $(\Lambda, \delta S)$  – irresolute.

b) Let  $V$  be any closed subset of  $Q$ . Since  $f$  is  $\delta$  – semicontinuous,  $f^{-1}(V)$  is  $\delta$  – semiclosed in  $P$ . we have  $f^{-1}(V)$  is  $(\Lambda, \delta S)$  – closed in  $P$ . therefore  $f$  is  $(\Lambda, \delta S)$  – continuous.

c) Let  $V$  be a  $\delta$  – semiclosed subset of  $Q$ . Since  $f$  is  $\delta$  – semi-irresolute,  $f^{-1}(V)$  is  $\delta$  – semiclosed in  $P$ . we have,  $f^{-1}(V)$  is  $(\Lambda, \delta S)$  – closed in  $P$ . therefore  $f$  is quasi  $(\Lambda, \delta S)$  – irresolute.

**Remark 1.** Composition of two  $(\Lambda, \delta S)$  – continuous functions need not be  $(\Lambda, \delta S)$  – continuous as shown by the following example.

**Example 2.** Let  $P = Q = \{p, q, r, s\}$ , and  $R = \{p, q, r\}$ . then  $\sigma = \{P, \emptyset, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$   $Q = \{Q, \emptyset, \{p\}, \{q\}, \{p, q\}\}$  and  $R = \{R, \emptyset, \{r\}\}$ . Let the function  $f : (P, \sigma) \rightarrow (Q, \tau)$  and  $g : (Q, \tau) \rightarrow (R, \eta)$  be defined by  $f(p) = s, f(q) = r, f(r) = p, f(s) = q$  and  $g(p) = p, g(q) = q, g(r) = r, g(s) = s$  then Composition  $(\Lambda, \delta S)$  – continuous functions need not be  $(\Lambda, \delta S)$  – continuous.

**Theorem 5.** Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  and  $g : (Q, \tau) \rightarrow (R, \eta)$  be two function hold:

- a) If  $f$  is  $(\Lambda, \delta S)$  - continuous and  $g$  is continuous then  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - continuous.
- b) If  $f$  is quasi -  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $\delta$  - semicontinuous then,  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - continuous.
- c) If  $f$  is  $(\Lambda, \delta S)$  - irresolute and  $g$  is super - continuous then,  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - continuous.
- d) If  $f$  is  $(\Lambda, \delta S)$  - irresolute and  $g$  is completely - continuous, then  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - continuous.
- e) If  $f$  is  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $(\Lambda, \delta S)$  - continuous, then,  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - continuous.

**Proof.** a) Let  $V$  be any closed subset of  $R$ . Since  $g$  is continuous,  $g^{-1}(V)$  is closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  - continuous,

$$f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V) \text{ is a } (\Lambda, \delta S)\text{-closed in } P.$$

therefore  $g \circ f$  is  $(\Lambda, \delta S)$  - continuous.

b) Let  $V$  be any closed subset of  $R$ . Since  $g$  is  $\delta$  - semicontinuous,  $g^{-1}(V)$  is  $\delta$  - semiclosed subset of  $Q$ . Since  $f$  is quasi -  $(\Lambda, \delta S)$  - continuous,

$$f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V) \text{ is a } (\Lambda, \delta S)\text{-closed in } P.$$

therefore  $g \circ f$  is  $(\Lambda, \delta S)$  - continuous.

c) Since every super continuous function is  $(\Lambda, \delta S)$  - continuous, therefore we have  $g$  is  $(\Lambda, \delta S)$ -continuous. Let  $V$  be any closed subset of  $R$ . Since  $g$  is  $(\Lambda, \delta S)$  - continuous,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  - closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  - irresolute.

$$f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V) \text{ is a } (\Lambda, \delta S)\text{-closed in } P.$$

therefore  $g \circ f$  is  $(\Lambda, \delta S)$  - continuous.

d) Since every completely continuous function is super - continuous

Therefore we have  $g$  is super - continuous. Hence from (c), the result follows.

e) Let  $V$  be closed subset of  $R$ . Since  $g$  is  $(\Lambda, \delta S)$  - continuous,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  - closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  - irresolute,

$$f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V) \text{ is a } (\Lambda, \delta S)\text{-closed in } P$$

therefore  $g \circ f$  is  $(\Lambda, \delta S)$  - irresolute.

**Theorem 6.** Let  $f: (P, \sigma) \rightarrow (Q, \tau)$  and  $g: (Q, \tau) \rightarrow (R, \eta)$  be two functions. Then the following hold:

- a) If  $f$  is  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is  $(\Lambda, \delta S)$  - irresolute.

b) If  $f$  is quasi -  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $\delta$  - semi-irresolute, then  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is quasi- $(\Lambda, \delta S)$  - irresolute.

c) If  $f$  is  $(\Lambda, \delta S)$  - irresolute and  $g$  is quasi- $(\Lambda, \delta S)$  - irresolute, then  $g \circ f: (P, \sigma) \rightarrow (R, \eta)$  is quasi- $(\Lambda, \delta S)$  - irresolute.

**Proof.** a) Let  $V$  be a  $(\Lambda, \delta S)$  - closed subset of  $R$ . Since  $g$  is  $(\Lambda, \delta S)$  - irresolute,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  - closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  - irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is a  $(\Lambda, \delta S)$ -closed in  $P$ .  
 $g \circ f$  is  $(\Lambda, \delta S)$  - irresolute.

b) Let  $V$  be a  $\delta$  - semiclosed subset of  $R$ . Since  $g$  is  $\delta$  - semi-irresolute,  $g^{-1}(V)$  is  $\delta$  - semiclosed subset of  $Q$ . Since  $f$  is quasi -  $(\Lambda, \delta S)$  - irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is a  $(\Lambda, \delta S)$ -closed in  $P$ .  
 $g \circ f$  is quasi  $(\Lambda, \delta S)$  - irresolute.

c) Let  $V$  be a  $\delta$  - semiclosed subset of  $R$ . Since  $g$  is quasi -  $(\Lambda, \delta S)$  - irresolute,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  - closed subset of  $Q$ . Since  $f$  is  $(\Lambda, \delta S)$  - irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is a  $(\Lambda, \delta S)$ -closed in  $P$ .  
 $g \circ f$  is quasi -  $(\Lambda, \delta S)$  - irresolute.

**Definition 22.** A function  $f: (P, \sigma) \rightarrow (Q, \tau)$  is said to be a completely  $(\Lambda, \delta S)$  - irresolute function if the inverse image of every  $(\Lambda, \delta S)$  - open subset of  $Q$  is regular open in  $P$ .

**Example 3.** Let  $P = \{p, q, r, s\}$ ,  $Q = \{p, q, r\}$  and  $\sigma = \{P, \emptyset, \{p\}, \{q, r\}\}$ ,  $\tau = \{Q, \emptyset, \{p\}, \{q\}, \{p, q\}, \{p, r\}\}$ . Let a function  $f: (P, \sigma) \rightarrow (Q, \tau)$  be defined by  $f(p) = q$ ,  $f(q) = p$ ,  $f(r) = r$ . Then  $f$  is  $(\Lambda, \delta S)$  continuous but not a  $\delta$ -semicontinuous function.

**Theorem 7.** Let  $f: (P, \sigma) \rightarrow (Q, \tau)$

a)  $f$  is completely  $(\Lambda, \delta S)$  - irresolute.

b) The inverse image of every  $(\Lambda, \delta S)$  - closed subset of  $Y$  is regular closed in  $P$ .

**Proof.** Obvious.

**Remark 2.** It is clear that every strongly continuous function is completely  $(\Lambda, \delta S)$  - irresolute. However the converse is not true by the following example.

**Example 4.** Same as Example 4.

**Theorem 8.** Every Completely  $(\Lambda, \delta S)$  - irresolute function is

a)  $(\Lambda, \delta S)$  - irresolute.

b)  $\delta$  – semi-irresolute.

c) Quasi -  $(\Lambda, \delta S)$  – irresolute.

d)  $R$  – map.

e) Almost  $\delta$  – continuous.

**Proof:** a) The result follows from the fact that every regular open set is  $(\Lambda, \delta S)$  – open.

b) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be a completely  $(\Lambda, \delta S)$  – irresolute function and  $V$  be an  $\delta$  – semiopen in  $Q$ . By Lemma 1, we have  $V$  is  $(\Lambda, \delta S)$  – open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ . Since every regular open set is  $\delta$ -semiopen,  $f^{-1}(V)$  is  $\delta S$ -open in  $P$ .  $\Rightarrow f$  is  $\delta$ – semiirresolute.

c) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be a completely  $(\Lambda, \delta S)$  – irresolute function and  $V$  be an  $\delta$  – semiopen in  $P$ . By Lemma 1,  $V$  is  $(\Lambda, \delta S)$  – open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ . Since every regular open set is  $\delta$  – semiopen,  $f^{-1}(V)$  is  $\delta$  – semiopen in  $P$ . By Lemma 1,  $f^{-1}(V)$  is  $(\Lambda, \delta S)$  – open in  $P$ .  $\Rightarrow f$  is quasi  $(\Lambda, \delta S)$  – irresolute.

d) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be a completely  $(\Lambda, \delta S)$  – irresolute function and  $V$  be a regular open set in  $Q$ . Since every regular open set is  $\delta$  – semiopen.  $V$  is  $\delta$  – semiopen in  $Q$ . By Lemma 1,  $V$  is  $(\Lambda, \delta S)$  open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ .  $\Rightarrow f$  is  $R$  – map.

e) Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be a completely  $(\Lambda, \delta S)$  – irresolute function and  $V$  be a regular open set in  $Q$ . Since every regular open set is  $\delta$  – semiopen.  $V$  is  $\delta$  – semiopen in  $Q$ . By Lemma 1,  $V$  is  $(\Lambda, \delta S)$  open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ .  $\Rightarrow f^{-1}(V)$  is  $\delta$  – semiopen in  $P$ . Hence  $f$  is almost  $(\Lambda, \delta S)$  – continuous.

**Remark 3.** The converse of the above theorem is not true as shown by the following examples.

### Example 5.

a) Let  $P = \{p, q, r, s\}$ ,  $Q = \{p, q, r, s\}$  and  $\sigma = \{X, \emptyset, \{p\}, \{r\}, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, r, s\}\}$ ,  $\tau = \{X, \emptyset, \{p\}, \{r\}, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, r, s\}\}$ . Let a function  $f : (P, \sigma) \rightarrow (Q, \tau)$  be defined an identity function. Then  $f$  is  $(\Lambda, \delta S)$  continuous but not a  $\delta$ -semicontinuous function.

b) Same as (a)

- c) Let  $P = \{p, q, r, s\}$ ,  $Q = \{p, q, r, s\}$  and  $\sigma = \{X, \emptyset, \{p\}, \{r\}, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, r, s\}\}$ ,  $\tau = \{X, \emptyset, \{p\}, \{r\}, \{p, q\}, \{p, r\}, \{p, q, r\}, \{p, r, s\}\}$ . Let a function  $f : (P, \sigma) \rightarrow (Q, \tau)$  be defined by  $f(p) = q$ ,  $f(q) = p$ ,  $f(r) = r$ ,  $f(s) = r$ . Then  $f$  is  $(\Lambda, \delta S)$  irresolute but not a Complete  $(\Lambda, \delta S)$  irresolute
- d) Same as (c).

**Definition 23.** A space  $(P, \sigma)$  is said to be  $(\Lambda, \delta)$  - space if every  $(\Lambda, \delta)$  - closed subset of  $P$  is  $\delta$  - semiclosed in  $P$ .

**Theorem 9.** Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be a completely  $\alpha$  - irresolute function where  $Q$  is a  $(\Lambda, \delta S)$  - space then  $f$  is completely  $(\Lambda, \delta S)$  - irresolute.

**Proof.** Let  $V$  be a  $(\Lambda, \delta S)$  - closed subset of  $Q$ . Since  $Q$  is a  $(\Lambda, \delta S)$  - space,  $V$  is  $\delta$  - semiclosed,  $V$  is  $\alpha$  - closed in  $Q$ . Since every  $\delta$  - semiclosed set is  $\alpha$  - closed,  $V$  is  $\alpha$  - closed in  $Q$ . Now  $f$  being completely  $\alpha$  - irresolute implies  $f^{-1}(V)$  is regular closed in  $P$ . therefore  $f$  is completely  $(\Lambda, \delta S)$  - irresolute.

**Theorem 10.** Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  and  $g : (Q, \tau) \rightarrow (R, \eta)$  be two functions. Then the following hold:

- If  $f$  is completely  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $(\Lambda, \delta S)$  - continuous, then  $g \circ f$  is completely continuous.
- If  $f$  is completely  $(\Lambda, \delta S)$  - irresolute and  $g$  is  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f$  is completely  $(\Lambda, \delta S)$  - irresolute.
- If  $f$  is almost  $\delta$  - semi-continuous and  $g$  is completely  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f$  is  $(\Lambda, \delta S)$  - irresolute.
- If  $f$  is completely continuous and  $g$  is completely  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f$  is completely  $(\Lambda, \delta S)$  - irresolute.
- If  $f$  is a  $R$  - map and  $g$  is completely  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f$  completely  $(\Lambda, \delta S)$  - irresolute.
- If  $f$  is completely  $(\Lambda, \delta S)$  - irresolute and  $g$  is a  $R$  - map, then  $g \circ f$  is almost  $\delta$  - semi-continuous
- If  $f$  is almost  $\delta$  - semi-continuous and  $g$  is completely  $(\Lambda, \delta S)$  - irresolute, then  $g \circ f$  is  $\delta$  - semi-irresolute.

**Proof.** a) Let  $V$  be an open set in  $R$ . Since  $g$  is  $(\Lambda, \delta S)$  - continuous.  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  - open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  - irresolute.  $f^{-1}(g^{-1}(V)) =$

$g \circ f^{-1}(V)$  is regular open in  $P$ . Hence  $g \circ f$  is completely continuous.

b) Let  $V$  be an  $(\Lambda, \delta S)$  – open set in  $R$ . Since  $g$  is  $(\Lambda, \delta S)$  – irresolute,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  – open in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute.  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is regular open in  $P$ . Hence  $g \circ f$  is completely  $(\Lambda, \delta S)$  – irresolute.

c) Let  $V$  be a  $(\Lambda, \delta S)$  – open set in  $R$ . Since  $g$  is completely  $(\Lambda, \delta S)$  – irresolute,  $g^{-1}(V)$  is regular open in  $Q$ . Since  $f$  is almost  $\delta$  – semi continuous,  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is  $\delta$  – semiopen in  $P$ . By Lemma 1,  $g \circ f^{-1}(V)$  is  $(\Lambda, \delta S)$  – open in  $P \Rightarrow g \circ f$  is  $(\Lambda, \delta S)$  – irresolute.

d) Let  $V$  be an  $(\Lambda, \delta S)$  – open set in  $R$ . Since  $g$  is completely  $(\Lambda, \delta S)$  – irresolute,  $g^{-1}(V)$  is regular open in  $Q$ . Since every regular open is open we have  $g^{-1}(V)$  is open in  $P$ . Since  $f$  is completely continuous.  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is regular open in  $P \Rightarrow g \circ f$  is completely  $(\Lambda, \delta S)$  – irresolute.

e) Let  $V$  be an  $(\Lambda, \delta S)$  – open in  $R$ . Since  $g$  is completely  $(\Lambda, \delta S)$  – irresolute,  $g^{-1}(V)$  is regular open in  $Q$ . Since  $f$  is a  $R$  – map,  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is regular open in  $P$ . Hence  $g \circ f$  is completely  $(\Lambda, \delta S)$  – irresolute.

f) Let  $V$  be an regular open set in  $Q$ . Since  $g$  is a  $R$ -map,  $g^{-1}(V)$  is regular open in  $Q$ . Since every regular open is  $\delta$ -semiopen,  $g^{-1}(V)$  is  $\delta$ -semiopen. Using Lemma 1,  $g^{-1}(V)$  is  $(\Lambda, \delta S)$  – open. Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is regular open in  $P$ .  $g \circ f^{-1}(V)$  is  $\delta$ -semiopen in  $P \Rightarrow g \circ f$  is almost  $\delta$ -semicontinuous.

g) Let  $V$  be a  $\delta$  – semi open set in  $R$ . Using Lemma 1,  $V$  is  $(\Lambda, \delta S)$ –open set. Since  $g$  is completely  $(\Lambda, \delta S)$  – irresolute,  $g^{-1}(V)$  is regular open in  $Q$ . Since  $f$  is almost  $\delta$  – semi continuous,  $f^{-1}(g^{-1}(V)) = g \circ f^{-1}(V)$  is  $\delta$  – semiopen in  $P$ . Hence  $g \circ f$  is  $\delta$  – semi irresolute.

**Theorem 11.** *If  $f : (P, \sigma) \rightarrow (Q, \tau)$  is a surjective,  $\delta^*$  - semiclosed function and  $g : (Q, \tau) \rightarrow (R, \eta)$  is a function such that  $g \circ f : (P, \sigma) \rightarrow (R, \eta)$  is completely  $(\Lambda, \delta S)$  – irresolute, then  $g$  is  $(\Lambda, \delta S)$  – irresolute.*

**Proof.** Let  $V$  be a  $(\Lambda, \delta S)$  – closed set in  $R$ . Since  $g \circ f$  is completely  $(\Lambda, \delta S)$  – irresolute.  $g \circ f^{-1}(V) = f^{-1}(g^{-1}(V))$  is regular closed in  $P$ . Since every regular closed set is  $\delta$  – semiclosed,  $f^{-1}(g^{-1}(V))$  is  $\delta$  – semiclosed in  $P$ . Now  $f$  is  $\delta^*$  – semiclosed and surjective implies  $f(f^{-1}(g^{-1}(V))) = g^{-1}(V)$  is a  $(\Lambda, \delta S)$  – closed in  $Q$ . Thus  $g$  is a  $(\Lambda, \delta S)$  – irresolute.

**Theorem 12.** *From the above result we have the following diagram where  $A \rightarrow B$  represents  $A$  implies but not conversely.*

a) Completely  $(\Lambda, \delta S)$  – irresolute

b) Almost  $\delta$  – semi-continuous

- c)  $\delta$  – semi-irresolute
- d) Quasi –  $(\Lambda, \delta S)$  – irresolute
- e)  $(\Lambda, \delta S)$  – irresolute
- f) Strongly continuous

**Lemma 3.** *Let  $S$  be an open subset of a topological space  $(P, \sigma)$ . Then the following hold:*

- a) *If  $U$  is regular open in  $P$ , then so is  $U \cap S$  in the subspace  $(S, \sigma_S)$ .*
- b) *If  $B \subset S$  is regular open in  $(S, \sigma_S)$  there exists a regular open set  $U$  in  $(P, \sigma)$  such that  $B = U \cap S$ .*

**Theorem 13.** *If  $f : (P, \sigma) \rightarrow (Q, \tau)$  is completely  $(\Lambda, \delta S)$  – irresolute and  $A$  is any open subset in  $P$ , then the restriction  $f|_A : A \rightarrow Q$  is completely  $(\Lambda, \delta S)$  – irresolute.*

**Proof.** Let  $V$  be any  $(\Lambda, \delta S)$  – open subset of  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ . Since  $A$  is open in  $P$ , by Lemma 1.  $(f|_A)^{-1}(V) = A \cap f^{-1}(V)$  is regular open in  $A$ . And so  $f|_A$  is completely  $(\Lambda, \delta S)$  – irresolute.

**Lemma 4.** *Let  $Q$  be a preopen subset of a topological space  $(P, \sigma)$ . Then  $Q \cap C$  is regular open in  $Q$  for every open subset  $U$  of  $P$ .*

**Theorem 14.** *If  $f : (P, \sigma) \rightarrow (Q, \tau)$  is completely  $(\Lambda, \delta S)$  – irresolute and  $A$  is any preopen subset in  $P$ , then the restriction  $f|_A : A \rightarrow Q$  is completely  $(\Lambda, \delta S)$  – irresolute.*

**Proof.** Let  $V$  be any  $(\Lambda, \delta S)$  – open subset of  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  is regular open in  $P$ . Since  $A$  is preopen in  $P$ , and by using Lemma 1  $(f|_A)^{-1}(V) = A \cap f^{-1}(V)$  is regular open in  $A$ . And so  $f|_A$  is completely  $(\Lambda, \delta S)$  – irresolute.

**Theorem 15.** *A topological space  $(P, \sigma)$  is connected if every completely  $(\Lambda, \delta S)$  – irresolute function from a space  $P$  into any  $T_0$  – space  $Y$  is constant.*

**Proof.** Suppose  $P$  is not connected and every completely  $(\Lambda, \delta S)$  – irresolute function from a space  $P$  into  $Q$  is constant. Since  $P$  is not connected, there exist a proper non empty clopen subset  $A$  of  $P$ . Let  $Q = \{p, q\}$  and  $\tau = \{Q, \emptyset, \{p\}, \{q\}\}$  be a topology for  $Q$ . Let  $f : P \rightarrow Q$  be a function such that  $f(A) = \{p\}$  and  $f(P - A) = \{q\}$ . Then  $f$  is non-constant completely  $(\Lambda, \delta S)$  – irresolute function such that  $Q$  is  $T_0$ , which is a contradiction. Hence  $P$  must be connected.

**Definition 24.** *A topological space  $(P, \sigma)$  is said to be*

- a)  $(\Lambda, \delta S)$  – connected if  $P$  cannot be written as a disjoint union of two nonempty  $(\Lambda, \delta S)$  – open subsets in  $P$ .
- b)  $r$  – connected if  $P$  cannot be written as a disjoint union of two nonempty regular open subsets in  $P$ .
- c) hyperconnected if every open subset of  $P$  is dense.

**Theorem 16.** If  $f : (P, \sigma) \rightarrow (Q, \tau)$  is completely  $(\Lambda, \delta S)$  – irresolute surjection and  $P$  is  $r$ -connected, then  $Q$  is  $(\Lambda, \delta S)$  – connected.

**Proof.** Suppose  $Q$  is not  $(\Lambda, \delta S)$  – connected. Then  $Q = A \cup B$  where  $A$  and  $B$  are disjoint nonempty  $(\Lambda, \delta S)$  – open subsets in  $Q$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute surjection,  $f^{-1}(A)$  and  $f^{-1}(B)$  are regular open sets in  $P$  such that  $X = f^{-1}(A) \cup f^{-1}(B)$  and  $f^{-1}(A) \cap f^{-1}(B) = \emptyset$  which shows that  $P$  is not  $r$ -connected. Which is a contradiction. Hence  $Q$  is  $(\Lambda, \delta S)$  – connected.

**Theorem 17.** Completely  $(\Lambda, \delta S)$ -connected image of hyperconnected space is  $(\Lambda, \delta S)$ -connected.

**Proof.** Let  $f : (P, \sigma) \rightarrow (Q, \tau)$  be completely  $(\Lambda, \delta S)$ -irresolute function such that  $P$  is hyperconnected. Assume that  $B$  is proper  $(\Lambda, \delta S)$ -clopen subset of  $Q$ . Then  $A = f^{-1}(B)$  is both regular open and regular closed set in  $P$  as  $f$  is completely  $(\Lambda, \delta S)$  – irresolute. Therefore  $A^- \neq P$ . This clearly contradicts the fact that  $P$  is hyperconnected. Thus  $Q$  is  $(\Lambda, \delta S)$  – connected.

**Definition 24.** A topological space  $(P, \sigma)$  is said to be

- a)  $(\Lambda, \delta S)$  –  $T_1$  if every pair of distinct points  $x$  and  $y$ , there exists  $(\Lambda, \delta S)$  – open sets  $G$  and  $H$  containing  $x$  and  $y$  respectively such that  $y \notin U$  and  $x \notin V$ .
- b)  $(\Lambda, \delta S)$  –  $T_2$  if for every pair of distinct points  $x$  and  $y$  there exists joint  $(\Lambda, \delta S)$  – open sets  $G$  and  $H$  containing  $x$  and  $y$  respectively.
- c)  $r - T_1$  if for every pair of disjoint points  $x$  and  $y$ , there exists  $r$ -open sets  $G$  and  $H$  connecting  $x$  and  $y$  respectively such that  $x \notin H$  and  $y \notin G$ .

**Theorem 18.** If  $f : (P, \sigma) \rightarrow (Q, \tau)$  be completely  $(\Lambda, \delta S)$ -irresolute injective function and  $Q$  is  $(\Lambda, \delta S)$  –  $T_1$ , then  $P$  is  $r - T_1$ .

**Proof.** Since  $Q$  is  $(\Lambda, \delta S)$  –  $T_1$ , for  $p \neq q$  in  $P$ , there exist  $(\Lambda, \delta S)$  – open sets  $V$  and  $W$  such that  $f(q) \notin V$ ,  $f(p) \notin W$ . Since  $f$  is completely  $(\Lambda, \delta S)$  – irresolute,  $f^{-1}(V)$  and  $f^{-1}(W)$  are regular open sets in  $P$  such that  $p \in f^{-1}(V)$ ,  $q \in f^{-1}(W)$ ,  $p \notin f^{-1}(W)$ ,  $q \notin f^{-1}(V)$ . This shows that  $P$  is  $r - T_1$ .

**Theorem 19.** *If  $f : (P, \sigma) \rightarrow (Q, \tau)$  be completely  $(\Lambda, \delta S)$ -irresolute injective function and  $Q$  is  $(\Lambda, \delta S) - T_2$ , then  $P$  is  $r - T_2$ .*

**Proof.** Since  $f$  is injective,  $f(x) \neq f(y)$  for  $x, y \in P$  and  $x \neq y$ . Since  $Q$  is  $(\Lambda, \delta S) - T_2$  there exists  $(\Lambda, \delta S) -$  open sets  $G$  and  $H$  in  $Q$  such that  $f(x) \in G$ ,  $f(y) \in H$  and  $G \cap H = \emptyset$ . Let  $U = f^{-1}(G)$  and  $V = f^{-1}(H)$ . Since  $f$  is completely  $(\Lambda, \delta S) -$  irresolute,  $U$  and  $V$  are regular open in  $P$ . Also  $x \in f^{-1}(G) = U$ ,  $y \in f^{-1}(H) = V$  and  $U \cap V = f^{-1}(G) \cap f^{-1}(H) = f^{-1}(G \cap H) = \emptyset$  Hence  $P$  is  $(\Lambda, \delta S) - T_2$ .

#### 4. Conclusion

In this paper, we have displayed the notions of  $(\Lambda, \delta S)$ -open sets and  $(\Lambda, \delta S)$ -closed sets and discussed their master properties. Then, we introduced some continuous function of  $(\Lambda, \delta S)$ -open sets. In addition, we have defined the so-called Quasi  $(\Lambda, \delta S)$  continuity, Perfect  $(\Lambda, \delta S) -$  continuity, Totally  $(\Lambda, \delta S) -$  continuity, Strongly  $(\Lambda, \delta S) -$  continuity, Contra  $(\Lambda, \delta S) -$  continuity via  $(\Lambda, \delta S)$ -open sets and the theorems based on them are discussed with counterexamples.

In future we will intruducing our set in Fuzzy topological space using fuzzy  $\delta$  which introduced by Tripathy B.C. [15, 16, 21].
